

Empathy Map

Date	04 July 2026
Team ID	
Project Name	HDI Predictor Using Machine Learning
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

SAYS - Requires accurate HDI models for policy planning, e.g., estimating future development levels. - Finds manual indicator analysis inefficient, e.g., comparing income, education, and health data manually. - Needs interpretable and reliable predictions, e.g., clear model outputs for decision-making.		THINKS - Which ML model predicts HDI most accurately, e.g., Random Forest, Linear Regression, or XGBoost? - Predictions should be fast and explainable, e.g., showing important features affecting HDI. - Key indicators can improve policy insights, e.g., literacy rate, life expectancy, and income level.
	PERSONA NAME <i>Government Policy Analyst</i>	

DOES • Preprocesses socioeconomic datasets, e.g., handles missing values and normalizes features.		FEELS • Confident with accurate, explainable outputs, e.g., low error values and clear feature importance.
• Analyzes HDI trends and feature relationships, e.g., correlation between education index and HDI. • Uses predictions for development assessment, e.g., ranking countries by predicted HDI category.		• Concerned about poor data quality, e.g., missing, outdated, or inconsistent country records. Satisfied with timely, • reliable results, e.g., quick HDI forecasts for policy reports.
