

Solution Requirements

Date	04 July 2026
Team ID	
Project Name	HDI Predictor Using Machine Learning
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Prediction should be generated quickly after input submission.	Response time less than 2 seconds
2	Scalability	Support multiple prediction requests without affecting performance.	Supports multiple simultaneous users

3	Security & Data Privacy	No personal information is stored. Input data is processed only for prediction.	Secure request handling
4	Reliability & Availability	Prediction service should remain available during normal operation.	99% availability
5	Usability & Accessibility	Simple interface with easy-to-understand input fields and result display.	User-friendly interface
6	Other	Maintainable Flask application with modular code structure and reusable ML model.	Easy maintenance and future enhancements
